

Potential $U(x)$
(Go-model landscape)

∇U

Symmetric mobility
 $G = \text{diag}(g) > 0$
(self-evolving)

local contacts Q_i
update g

Antisymmetric mobility
 $A = a\sqrt{G}J\sqrt{G}$

Discrete-gradient step for $\dot{x} = -(G + A)\nabla U$
 $U(y) - U(x) = -h \bar{\nabla} U \cdot G \bar{\nabla} U \leq 0$

DiBaS cap: $s = \min(1, D_{\max}/D)$
(rescales the step)

Terminal-state diagnosis
(read-only; no feedback)
